Лабораторная работа N4

Используя схемы переменных направлений и дробных шагов, решить двумерную начально-краевую задачу для дифференциального уравнения параболического типа. В различные моменты времени вычислить погрешность численного решения путем сравнения результатов с приведенным в задании аналитическим решением U(x,t). Исследовать зависимость погрешности от сеточных параметров $^{\mathbf{\tau},h_x,h_y}$.
